Art Unit: 2176

DETAILED ACTION

This is a **Final rejection** in response to RCE filed on 07/23/2007, Effective filing date 10-24-2003. Claims 1-39 are pending.

Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 07/23/2007 has been entered.

It is noted, there is neither Remark nor Amendment filed with the RCE, in responses to the Final Office Action mailed 01/23/2007.

Art Unit: 2176

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1-39 are rejected under 35 U.S.C. 103(a) as being unpatentable over Block et al - US 2003/0037038, filed March 4, 2002 (hereinafter Block), in view of Malloy et al - US 2004/0122844, filed Dec 2002 (hereinafter Malloy).

Regarding independent claim 1, Block teaches:

receiving from a user a selection of a portion of said grid, said selection indicating internal metadata to be mapped.

For example, Block discloses a method for adding metadata to data, where labels are selected that correspond to metadata such as text strings in the identified data, based on a list that associates labels with text strings where metadata can be substituted for each occurrence of text string (Block para 38). The examiner interprets selection of labels as equivalent to the claimed **user selection of a portion of said grid,** because those labels are identified by the user.

In addition, Block teaches creating a mapping between said selected internal metadata and said defined external metadata. For example, Block disclose an

Art Unit: 2176

import/export Extended Business Reporting Language (XBRL) compliant data set into a non XBRL compliant target application, wherein a user associating entries in the export file with labels defined in one or more appropriate XBRL taxonomies, and forming an import file for import into the target program by replacing data in the export file at entries associated with specific labels, with data from the data set having corresponding labels. In another word, the identified data are mapped to an XBRL database or a file (Block para 14, and 16).

In addition, Block does not teach, but Malloy teaches receiving from said user a definition of external metadata describing all data points within said selection. For example, Malloy discloses a method for adding metadata to data, where metadata objects are grouped together by their relationships to each other into a metadata object called a cube model, and the cube model represents a particular grouping of relational tables in order to allow users to generate complex queries (Malloy para 65) where the user creates or modifies metadata objects by submitting commands via the user interface (Malloy para 59).

Furthermore, Block does not teach, but Malloy teaches organizing internal metadata in a grid having rows and columns, wherein dimensional metadata from said internal metadata is places in the grid as row headings and/or column headings. For example, Malloy discloses a method for adding metadata to data, where metadata objects are grouped together by their relationships to each other into a metadata object called a cube model, and the cube model represents a particular grouping of relational tables in order to allow users to generate complex queries (para

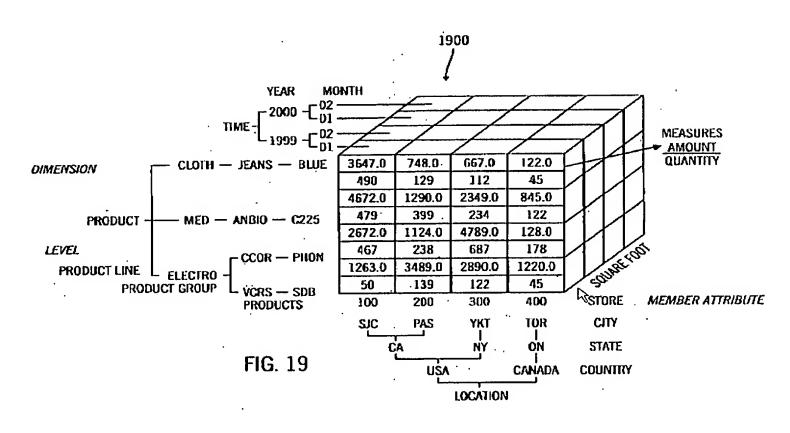

Art Unit: 2176

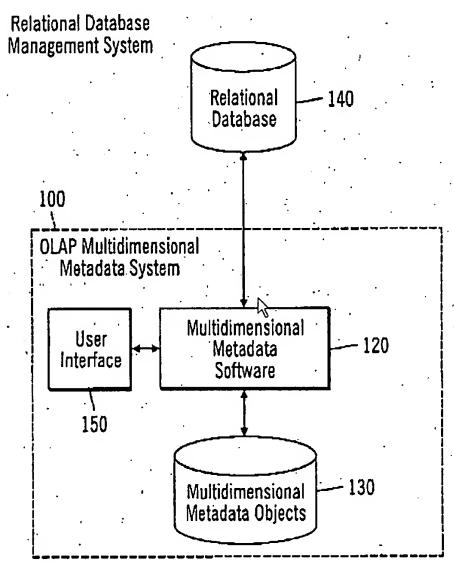

65) using a database to manage multidimensional metadata objects (para 58). The cube metadata object references a cube model metadata object (para 147; see Table 16).

In addition, Block does not teach explicitly teach, but Malloy teaches to receive a selected portion of a grid indicating internal metadata to be mapped to external metadata in an external system. Specifically, Malloy discloses an On-line analytical processing (OLAP) multi-dimensional system referred to as "metadata objects", includes a user interface item 150, and the metadata objects may reside on a data store other than the database catalog or may reside across multiple data stores. For example, multidimensional metadata software 120 may create and store multidimensional metadata objects 130 (Malloy page 3 para 57, 59, and 61, Fig. 1 and 19). In addition, Malloy discloses a method for adding metadata to data, where metadata objects are grouped together by their relationships to each other into a metadata object called a cube model, and the cube model represents a particular grouping of relational tables in order to allow users to generate complex queries (para 65) using a database to manage multidimensional metadata objects (para 58). The cube metadata object references a cube model metadata object (para 147; see Table 16). The examiner interprets the identified data as equivalent to the claimed internal metadata. Block discloses identified data are mapped to an XBRL database, a spreadsheet, or a file (para 14). The examiner interprets the database, spreadsheet or a file as equivalent to the claimed external metadata. And also the Examiner reads the claimed mapped to external metadata in an external system as equivalent to Malloy's metadata, wherein the

Art Unit: 2176

metadata objects reside on a data store other than the database catalog or may reside across multiple data stores.

Art Unit: 2176

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify Block to include a cube metadata object that references a cube model metadata object that shows the relationships amongst metadata objects, wherein a user interface item 150, receiving from said user a definition of external metadata describing all data points within said selection to be mapped to external metadata in an external system, and organizing internal metadata in a grid having rows and columns, wherein dimensional metadata from said internal metadata is places in the grid as row headings and/or column headings as taught by Malloy. One of ordinary skill in the art would have been motivated to modify this combination to providing the benefit of an improved relational OLAP system (Malloy, para 20) with multidimensional reports for metadata associated with other metadata stored externally (Malloy, para 17, 21).

Regarding independent claim 18,

is directed an apparatus to perform the method of claim 1 which cites above, and are similarly rejected under the same rationale.

Regarding independent claim 23,

is directed an apparatus to perform the method of claim 1 which cites above, and are similarly rejected under the same rationale.

Art Unit: 2176

Regarding claims 2 and 24, Block teaches:

retrieving the internal metadata from a database.

For example, Block discloses mapped to a database (Block para 14).

Regarding claims 3 and 25, Block teaches:

determining if the external metadata describing all data points within said selection is predefined; and wherein if the external metadata describing all data points within said selection is predefined, said receiving from said user a definition of external metadata comprises: presenting said user a list from which they may select an item of predefined metadata; and receiving from said user a selection of an item of predefined metadata from said list.

For example, Block discloses in the method for adding metadata to data, a data element can be imported directly to a specific location within the database, using an independent software application, based on a label associated with both the location and the elements (Block para 18).

Regarding claims 4 and 26, Block does not expressly teach, but Malloy teaches wherein said list is provided in a tree control. Specifically, Malloy discloses a reference tree (Malloy para 159).

Art Unit: 2176

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify Block to include a reference tree as taught by Malloy, providing the benefit of an improved relational OLAP system (Malloy, para 20).

Regarding claim 5 and 27, Block teaches:

determining if syntax of the external metadata describing all data points within said selection is predefined; and wherein if the external metadata describing all data points within said selection is not predefined, but syntax of the external metadata describing all data points within said selection is predefined, said receiving from said user a definition of external metadata comprises: presenting said user with one or more dialog boxes in which they can specify external metadata to be created; and receiving from said user a specification of external metadata to be created.

For example, Block discloses in the method for adding metadata to data, a data element can be imported directly to a specific location within the database, using an independent software application, based on a label associated with both the location and the elements (Block para 18).

Art Unit: 2176

Regarding claims 6-7 and 28-29,

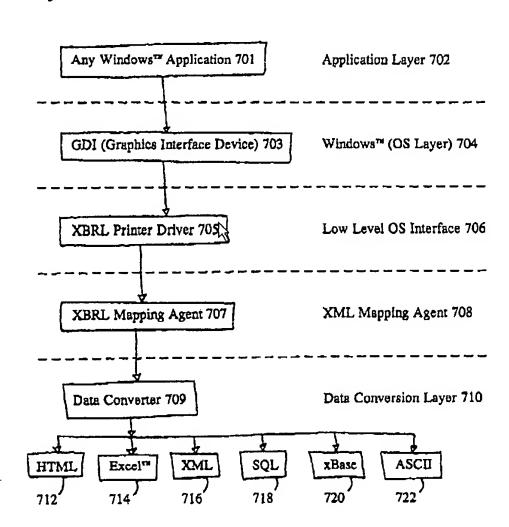

the rejection of claim 1 is fully incorporated.

In addition, Block teaches:

wherein said presenting includes presenting said user with a dialog box.

Specifically, Block discloses a Windows Graphic Interface Device (Block para 63; Fig 7, item 704).

Fig. 7

Art Unit: 2176

Regarding claims 8 and 30,

the rejection of claim 1 is fully incorporated.

In addition, Block teaches:

wherein said presenting includes presenting said user with a dialog

box.

Specifically, Block discloses a Windows Graphic Interface Device (Block para 63; Fig 7,

item 704).

Block does not expressly teach, but Malloy teaches time period. For example,

time as a data attribute of the data values of the system (Malloy para 9).

It would have been obvious to one of ordinary skill in the art at the time of the

invention to modify a Graphic Interface Device in a Windows environment as taught by

Block to include, time period dimensions as taught by Malloy for providing the benefit of

automating entry of XML and XBRL compliant data into non-XML or non-XBRL

compliant programs or applications (Block, para 12) and further to include time period

as taught by Malloy, providing the benefit of an improved relational OLAP system

(Malloy, para 20).

Regarding claims 9 and 31,

the rejection of claim 1 is fully incorporated. In addition, Block teaches:

wherein said presenting includes presenting said user with a dialog

box.

Art Unit: 2176

Specifically, Block discloses a Windows Graphic Interface Device (Block para 63; Fig 7, item 704).

Regarding claims 10 and 32,

the rejection of claims 1 and 4 are fully incorporated.

In addition, Block teaches:

an element button is selected and a text field when a custom button is selected.

Specifically, Block discloses a Windows Graphic Interface Device (Block para 63; Fig 7, item 704).

Regarding claims 11 and 33, Block teaches:

selecting. For example, selecting labels (para 15). Block does not expressly teach rows, but Malloy does teach rows. For example, selecting a subset of possible elements with rows of data (Block para 140, para 180).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify Block to include rows as taught by Malloy, providing the benefit of an improved relational OLAP systém (Malloy, para 20).

Art Unit: 2176

Regarding claims 12 and 34, Block teaches:

selecting. For example, selecting labels (para 15).

Block does not expressly teach **columns**, but Malloy does teach **columns**. For example, selecting a subset of possible elements with rows of data (Block para 140, para 180).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify Block to include rows as taught by Malloy, providing the benefit of an improved relational OLAP system (Malloy, para 20).

Regarding claims 13 and 35, Block teaches:

selecting individual cells in said grid.

For example, in a spreadsheet, selecting labels (Block para 14, 15).

Regarding claims 14 and 36, Block teaches:

receiving from said user a formula involving one or more data items in said grid; creating a new row or column in said grid; entering said formula into a cell in said new row or column; and wherein said selection includes said cell.

For example, Block discloses a spreadsheet program, wherein any data can be overwritten in individual cells (Block para 14, 15).

Art Unit: 2176

Regarding claims 15 and 37, Block teaches:

receiving from said user a formula involving one or more data items in said grid; creating a new row or column in said grid; entering said formula into a cell in said new row or column; and wherein said selection includes said cell.

For example, Block discloses identified data are mapped to a spreadsheet and based on a broad reasonable interpretation of the claimed; the limitations are implementable on any spreadsheet program (Block para 14).

Regarding claims 16 and 38, Block teaches:

external metadata is Extensible Business Reporting Language (XBRL) metadata (Block para 14).

Regarding claims 17 and 39,

the rejection of claim 1 is fully incorporated.

In addition, Block teaches:

schema manager. For example, Block discloses identified data are mapped to a schema (Block para 14).

Art Unit: 2176

Regarding Claim 19, Block teaches:

an internal metadata database retriever coupled to said internal metadata grid organizer.

For example, Block discloses mapping to a spreadsheet (Block para 14).

Regarding Claim 20, Block teaches:

a predefined external metadata selection determiner coupled to said external metadata user definition receiver; and wherein said external metadata user definition receiver includes: a predefine metadata list presenter; and a predefined metadata list item receiver coupled to said predefined metadata list presenter.

For example, Block discloses on a spreadsheet and/or database, adding labels to data including identifying data in the file, selecting labels based on list associating labels with text strings (Block para 14, 15).

Regarding Claim 21, Block teaches:

a predefined external metadata syntax determiner coupled to said external metadata user definition receiver; and wherein said metadata dialog box presenter; and an external metadata specification receiver coupled to said external metadata dialog box presenter.

Art Unit: 2176

For example, on a spreadsheet and/or database, adding labels to data including identifying data in the file, selecting labels based on list associating labels with text strings (para 14, 15).

In addition Block teaches a dialog box. Specifically, Block discloses a Windows Graphic Interface Device (para 63; Fig 7, item 704).

Regarding Claim 22, Block teaches:

a user formula receiver; a new row or column creator coupled to said user formula receiver and to said internal metadata grid organizer; a new row or column user formula placer coupled to said new row or column creator and to said user formula receiver.

For example, Block discloses a spreadsheet receives formulas (Block para 14). Also Block discloses, a spreadsheet creates new rows/columns in association with formulas (Block para 14, 15), and a spreadsheet allows for placement of formulas to integrate with cells (Block para 14, 15).

It is noted that any citations to specific, pages, columns, lines, or figures in the prior art references and any interpretation of the references should not be considered to be limiting in any way. A reference is relevant for all it contains and may be relied upon for all that it would have reasonably suggested to one having ordinary skill in the art. See, MPEP 2123.

Art Unit: 2176

Conclusion

All claims are drawn to the same invention claimed in the application prior to the entry of the submission under 37 CFR 1.114 and could have been finally rejected on the grounds and art of record in the next Office action if they had been entered in the application prior to entry under 37 CFR 1.114. Accordingly, THIS ACTION IS MADE

FINAL even though it is a first action after the filing of a request for continued examination and the submission under 37 CFR 1.114. See MPEP § 706.07(b).

Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Quoc A. Tran whose telephone number is 571-272-8664. The examiner can normally be reached on Monday through Friday from 9 AM to 5 PM EST.

Art Unit: 2176

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Doug Hutton can be reached on 571-272-4137. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
